Abstract—This report deals with the design and implementation of a Home Security system through mobile devices, that take advantage of mobile technology to provide essential security to our homes that does not require specific hardware or skilled technicians. We have proposed to remotely monitor security surveillance system through cloud computing using any Internet enabled device. As an interruption is detected, an SMS alert will be given to the user and the user can view the video and image of the intruded room through Email or SMS and can secure his house by giving an alert to the vicinal. The user can monitor the intrusion from anywhere, on any internet enabled device. If the intrusion is true, the user is provided with the options to quietly alert proximate, play alarm sounds and post to the police. Thus, theft can be prevented. The implementation shows three use scenarios: (a) functioning and controlling video cameras for remote monitoring through mobile devices; (b) streaming live video from device and sending captured image to user’s mobile devices; (c) recording and saving videos as well as images on a cloud computing platform for future playback. Furthermore, our application is not only limited to smart phones but also can be used by feature phones through their browsers.

Keywords

1. INTRODUCTION
Currently the devices are standalone and require the users to be physically present to operate the devices with no interaction possible between two different devices. The system is also limited by its computational resources and storage capacity. For this project, I have developed a cloud based client server architecture to address these limitations and also to provide security and sharing functionalities along with remote diagnostics. This project has a device level framework to communicate with and exchange information with a cloud server. It will help you watch over your business, home, and other important locations. Our reliable cloud-based infrastructure ensures that you are notified whenever something in your environment needs your attention. Whether you feel the need to keep an eye out for intruders at home, keep tabs on the baby in the other room or just want to see what your pets are doing when you're not around, cloud security cameras can help. These cameras offer more flexibility than do regular webcams because they typically use a Web portal, rather than a laptop or personal computer, as the monitoring and control hub, allowing you to check in from anywhere -- including your smartphone. But keep your expectations in check. While you can use the cameras to get the gist of what's going on at home, the quality of video can be downright awful when streamed over your home Wi-Fi, through the public Internet and over the cellular data network to your smartphone. Most home security companies require a technician to come and install security systems. Not only are you inviting a stranger into your house, but this could cost hundreds to thousands of dollars. It is especially expensive if your home isn't pre-wired or you go with an elaborate system. You do not need to install any additional software. Simply open a browser, log into your account — and watch live video feeds and surveillance archives, configure notifications and manage your cameras’ access. You just need to connect your cameras to the cloud, and you'll be able to access them from anywhere.

2. SYSTEM ARCHITECTURE
This app can display live video feeds and provide you screenshots of what you're viewing at any given time. It only requires camera enables mobile device placed at home which will capture streams and transmit to user’s mobile device. It supports night vision functionality. It is recommended because it not only enables you to see clearly what's happening in dark rooms at night, but also makes it easier to see what's going on in dimly lit rooms on cloudy days. When you do get alerts, they generate either one or more still images or a link to a video clip that typically lasts about 30 seconds. It let you store images in the Gateway server. For security, it require a user account name and password, and some additional details to access device. All video streams from your cameras go through the Gateway server before arriving at your mobile device or personal computer. The Gateway server acts as the mediator, imparting video feeds and storing video clips. Because the Gateway server sends out the email alerts, all you need to do is provide the email address to which you want the alerts sent and you're done. Currently, the security services offered in our server are:
(1) Real-time Monitoring,
(2) SMS notifications and user’s confirmation in case of intrusion detection.

3. HOME SECURITY
3.1 Remote-Control based Monitoring
In remote monitoring, the camera is manually controlled. In case user detects that camera at home is turned off he can turn it on remotely by sending alert to phone placed at home. This approach provides a convenience for user away from home to operate camera for implementing surveillance. After user login process, mobile terminal is capable to activate a residential camera to capture images/video through sending command to gateway that controls camera directly.
A remote-control based monitoring use scenario

Use case 1 shows how remote user utilizes mobile devices to control and acquire monitoring media resource, as shown in Fig 6. Possible messages flows are:

1) Alice (user of mobile device) detects that camera at home is not functioning so sends a control command (Message “VIEW CAMERA”) to gateway Fig. a.
2) Home gateway analyses the command received and activates a camera Fig. b.
3) The camera captures images and regularly sends media data back to gateway.
4) Home gateway generates media files, and sends a response to Alice.
5) Alice sends a request to gateway server for downloading media resource.
6) Cloud server sends a response which includes media data back. Alice is capable to play and watch monitoring media resource.

3.2 System Design

3.2 Wowza Streaming Engine

Switching to Wowza allowed us to significantly increase our number of webcasts. We don’t have to worry about the number of connections or viewers. We’re confident the infrastructure will support the load. Wowza Streaming Engine is robust, customizable media server software that powers reliable streaming of high-quality video and audio to any device, anywhere. Whether you deploy it in the cloud or on premises, Wowza Streaming Engine software offers powerful components to tailor your streaming workflows with confidence. Deployment Options

On Premises Run Wowza Streaming Engine on one or more computers at your physical location, on your hardware, across your internet connection. Cloud Deploying Wowza® software in the cloud means streaming your content from high-performance virtual machines hosted remotely. Works with virtually all cloud hosting services, including Amazon EC2, Google Compute Engine and others.

3.3 Virtual Private Server Configuration

About GoDaddy

GoDaddy is a publicly traded Internet domain registrar and Web hosting company. As of 2014, GoDaddy was said to have had more than 59 million domain names under management, making it the world's largest ICANN-accredited registrar. It serves more than 12 million customers and employs more than 4,000 people. The company is known for its celebrity spokespeople, Super Bowl ads and as being an online provider for small businesses. In addition to a post season college football bowl game, it sponsors NASCAR. It has been involved in several controversies related to security and privacy. In addition to domain registration and hosting,
GoDaddy also sells e-business related software and services. Domains by Proxy (DBP) is an Internet company owned by GoDaddy founder Bob Parsons. It offers domain privacy services through partner domain registrars such as GoDaddy and Wild West Domains. Subscribers list Domains by Proxy as their administrative and technical contacts in the Internet's WHOIS database, thereby delegating responsibility for managing unsolicited contacts from third parties and keeping the domains owners personal information safe from the public eye. However, a registrant's personal information can be released in some cases, such as a legal subpoena or cease and desist legal process, or for other reasons as deemed appropriate by DBP per its Domain Name Proxy Agreement. Over 9,850,000 domain names currently use the Domains by Proxy service.

3.4 Fast Forward Motion Pictures Expert Group (FFMPEG)

Ffmpeg is the leading multimedia framework, able to decode, encode, transcode, mux, demux stream, filter and play pretty much anything that humans and machines have created. It supports the most obscure ancient formats up to the cutting edge. No matter if they were designed by some standards committee, the community or a corporation.

It contains libavcodec, libavutil, libavformat, libavfilter, libavdevice, libswscale and libswresample which can be used by applications. As well as ffmpeg, ffserver, ffplay and ffprobe which can be used by end users for transcoding, streaming and playing.

The FFmpeg project tries to provide the best technically possible solution for developers of applications and end users alike. To achieve this we combine the best free software options available. We slightly favor our own code to keep the dependencies on other libs low and to maximize code sharing between parts of FFmpeg. Wherever the question of "best" cannot be answered we support both options so the end user can choose.

4. USER INTERFACE
5. CONCLUSION AND FUTURE SCOPE

It works on almost all devices with a built-in Internet browser, but provides a simplified website for them. Although having fewer features, it is the best solution to quickly check what is happening in front of your surveillance cameras. Video surveillance has never been this easy to use. All you need to have to access your cameras is a computer with an Internet connection.

Cloud computing has been making significant inroads in the domain of application development. The fact that companies can rely on huge amounts of storage and computational ability without worrying about scalability and availability of resources has brought a lot of visibility to the cloud platform. This project has allowed me to develop a framework working with the android platform and the cloud platform to leverage the benefits of both to provide a seamless integrated solution, addressing the limitations of both the platforms. For my project, I have combined the portability and optimization of mobile devices with the computational resources and storage capabilities of cloud servers bringing together a solution which can easily be expanded to provide multiple functionalities depending on the domain. Working on this project, has allowed me to work with and learn multiple development environments like Android, which is one of the fastest growing operating systems. Because the project involved communications between the client was an android application, memory usage and application stability was a primary concern. Because images and the mobile camera are used significantly, I have optimized my code was a primary concern. Because images and the mobile camera are used significantly, I have optimized my code efficiently to handle memory issues by detecting when the camera are used significantly, I have optimized my code was a primary concern. Because images and the mobile camera are used significantly, I have optimized my code efficiently to handle memory issues by detecting when the camera.

The future work for this project will be to integrate the application with the Qolysys Home Security System, and work on developing additional features to further improve the product. On improving the security surveillance system, we plan to add more social integration through social networking sites like Facebook and Google+. With the help of these online social networks, we can easily contact and notify a user’s friends in case of an intrusion event and thus make burglary prevention more effective. For further work project will be deployed on cloud. The use of cloud services in home automation derives many benefits extending from cost reduction to value added services. In the future we intend to detects Smoke and fire.

ACKNOWLEDGMENTS

The making of the project needed cooperation and guidance of a number of people. We therefore consider it our prime duty to thank all those who had helped us for making it successful. It is our immense pleasure to express our gratitude to Mrs. Pradnya S. Gotmare (assistant professor in the Department of Computer Engineering) as a guide who provided us constructive and positive feedback during the preparation of this Project and as a mentor, giving rich critiques of my research, methods and development; she helped to improve all three. A very special, and well-deserved, thank you to Mr. Shishir Shetty He guided me throughout the project life-cycle, helping taking critical decisions and suggesting canonical path to achieve what needed to be done. Last but not least, We are thankful to our friends and library staff members whose encouragement and suggestion helped us to complete our Project. We are also thankful to our parents.
